

The Hyacinth macaw is the largest parrot in the world, measuring nearly 40 inches (100 cm). It is blue overall with yellow eye-rings and yellow skin on each side of the beak. With their strong beaks, they eat larger nuts from palm trees as well as fruits, seeds and flowers that can be found in the trees in South America. It takes up to 28 days for the two eggs that were laid to hatch and the chicks leave the nest after 100 days. These chicks will stay with the parents for another 6 months.
